humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk

On Aug 13, 2000 this sequence version replaced gi:8978010.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
                                                                                                                                                                                                                                                                                                    /procein_ii="BaA91926.1"

regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                    rucleic acid probes for measuring gene expression in a sample derived from muman breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene determining predisposition and/or prognosing breast disease. Gene agents on cells. The microarray of this invention presents a far greater disciplination of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human brain expressed single exon probe encoded protein SEQ ID NO: 28373.
                                                                                                                                                                                                                                                                                                             probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           589 HLIMHSGMNATTIHFNLTFQNTNDEEFKMQITVEVDTREGPKLNSTAQKGYENLVSPITL 648

                                                                                                                                                             δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                               for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        EHGDITLKGYNLSKSALLRSFLANSQHAKIKNQAIITDETNDSLVAPQEKQVHKSILPNS 768
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LPEAEILFEDIPKEKRFPKFKRHDVNSTRRAQEEVKIPLVNISLLPKDAQLSLNTLDLQL 708

The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                     Peptide #2989 encoded by probe for measuring placental gene expression.

The present invention relates to novel single exon nucleic acid probes (see AAI00010-AAI10067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Probe; human; breast disease; breast cancer; development disorder; inflammatory disease; proliferative breast disease; non-carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel single exon nucleic acid probe used to measuring gene expression

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 nucleic acid expression in the specification or their probes; the novel set of probes which hybridise at high stringency to a probes; the novel set of probes which hybridise at high stringency to a collection of detectably labeled nucleic acid expression in a expression of detectably labeled nucleic acid expression in a everything exons in a eukaryotic genome, comprising the array identifying exons in a eukaryotic genome, comprising the array identifying exons in a eukaryotic genome, comprising the array identifying exons in a eukaryotic genome, comprising the array identifying exons in a eukaryotic genome, comprising the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, labeled nucleic acids from eukaryote lung mRNA, to a single exon it is above and (b) measuring the expression of each of the exons in the tissues and/or cell types using hybridisation to a single exon it caperages and (contrary assigning exons in a several incomprising one comprising one comprising one comprising one comprising a probe with the exon, where a common pattern of arroes/open reading frames (ORF). The probes are used for gene expression analysis, and for the secons in the specification, or encoded by the exons should be assigned to a single exon probes are used for gene expression analysis, and for the secons in a gene expendences, pulmonary alveolar proteined manalysis, surface and plantament sequence and plantament disease. The present sequence is a peptide-pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

```
The present invention describes primer sets for synthesising 5602

C full-length cDNAs defined in the specification. Where a primer set

C full-length cDNAs defined in the specification. Where a primer set

C comprises: (a) an oligo-dT primer and an oligounclectide comprises one of

the 5602 nuclectide sequences defined in the specification, where the

CC chigonuclectide comprises at least 15 nuclectides; or (b) a combination

of an oligonuclectide comprising a sequence complementary to the

complementary strand of a polynuclectide which comprises a 5'-end

sequence and an oligonuclectide comprising a sequence complementary to a

polynuclectide which comprises a 3'-end sequence complementary to a

complementary strand of a sequence is selected from those defined in

the specification. The primer sets can be used in antisense therapy and

the specification. The primers are useful for synthesising polynuclectides,

cc particularly full-length cDNAs. The primers are also useful for the

detection and/or adaposis of the abnormality of the protains encoded by

the full-length cDNAs. The primers allow obtaining of the full-length

cDNAs easily without any specialised methods. AAH03166 to AAH13628 and

AAH1363 to AAH1842 represent human amino acid sequences; and AH13629 to AAH3620

represent oligonuclectides, all of which are used in the exemplification

                                                                                                                                                                                                                                                                                                                                                          The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimar's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Single exon nucleic acid probes for analyzing gene expression in human

                                                                                                                                                                                                              probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

The present invention relates to single exon nucleic acid probes (SENP: see AA13115-AA57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human peptide encoded by genome-derived single exon probe SEQ ID 30805.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 complements or the 12387 open reading frames derived from the 12614 nucleic acid expression in the sample derived from human lung, comprising (a) contacting the novel set of probes which hybridise at high stringency to a nucleic acid expression in a cample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung the label detectably bound to each probe of the auxayote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from evaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon probe, having a fragment identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hypridisation to a single exon and comprising one of 12011 sequences, mentioned in the specification, or encoded by the expression nallysis, and for identifying exons in a gene, particularly expression nallysis, and for identifying exons in a gene, particularly expression mallysis, and for identifying exons in a gene, particularly expression mallysis, and for identifying exons in a gene, particularly expression human lung derived mRNA and for the study of lung disease.

C (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary disease.

Nemmonsiders, mallynesses, Hemmansk-Pulmonario leiomycone, ascidences or probable or probable or probable or probable or p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      haemosiderosis, pulmonary histiocytosis, lymphangioleiomyomicosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    113 EKQLECLLTHCIKVPMLVLDPALPANITLKDLPSLYPSFHSASDIFNVAKPKNPSTNVSV 172
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This polypeptide is encoded by ORF2, one of 4 open reading frames identified in the region between the ctrA and galE genes of the encapsulated serogroup A Neisserla meningildids strain F8239.

The ORF2 protein is predicted to be a UDP-N-acetyl-mannosamine (alphal-6) polymerase involved in the biosynthesis of the serogroup AAM7927-98) are also thought to be involved in capsule biosynthesis or modification. The invention provides a model in which meningococcal capsular serogroups are determined by specific genetic biosynthesis cassettes that insert between the ctrA operon and galE. For serogroup A, the cassettes determining specificity of serogroups can recombine to switch the type of capsule and serogroup expressed. Such information is critical to the design of improved group A and other meningococcal vaccines and to the understanding of the molecular basis of serogroup A pathogenesis. The invention provides recombinant meningococcal strains, recombinant DNA provides recombinant meningococcal strains, recombinant DNA provides recombinant meningococcal strains, recombinant meningococcal strains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         252 -ELYKKYKPDFNSDATSTSRFLSRDELKFALRSWEMSGSFIRKIFIVSNCAPPAWLDLNN 310

polypeptides, useful for treating a MOLX-associated disorder, e.g. cardiomyopathy, atherosclerosis, diabetes and metabolic disorders Nucleic acids encoding secreted polypeptides, designated MOLX polypeptides,

Claim 1; Page 11; 223pp; English.

The patent discloses nucleic acid sequences encoding novel secreted molecule (MOL) polypeptides, designated MOLX polypeptides (i.e. a MOL protein where X is an integer from 1 to 8). Sequences of the invention are useful for treating or preventing a MOLX-associated disorder in humans. They are useful for treating or preventing cardiomyopathy, atherosclerosis and disorders related to cell signal processing and metabolic pathway modulation. The MOLX antibodies are useful for

•

treating or preventing diabetes and disorders related to cell signal processing and metabolic pathway modulation. MOLX sequences are useful for the treatment or diagnosis of other MOLX-associated disorders, e.g. chromosomal disorders, albinism, anaemia, liver cirrhosis, psoriasis, scarting, neurodegeneration, osteoarthritis, organ rejection, cerebral thrombosis, ischaemia, hypertension, systemic lupus erythematosus, immune diseases, immunodeficiency, HIV (human immuno deficiency virus), viral, bacterial and fungal infections, hepatitis, rheumatoid arthritis, asthma, laematopoietic, thrombolytic, heamatoid siscases, thrombocytopaenia, ulcers, Alzheimer's disease, Parkinson's disease, Huntington's disease, ocular disease, muscular diseases, growth disorders, loss of libido, stress, depression, pain and epilepsy. They are useful for preventing chemotherapy side effects and as contraceptives. Sequences of the human Marchillo, are also useful for gene therapy. The present sequence is human Notch-like protein, MOLla.

Jaggedl, Jaggedl and Deltal to regulate cell-fate determination.
Upon ligand activation through the released notch intracellular open and activates genes of the enhancer of split locus.

KBP-J kappa and activates genes of the enhancer of split locus.
Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May play an essential role in postimplantation development, probably in some aspect of cell specification and/or differentiation.

C -1- SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus. ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be produced by alternative splicing.
TISSUE SPECIFICITY: Expressed in the brain, liver, kidney, neuroepithelia, somites, optic vesicles and branchial arches, but

-!- FUNCTION: Functions as a receptor for membrane-bound ligands
-!- FUNCTION: Functions as a receptor for membrane-bound ligands
Jaggedl. Jaggedz and Deltal to requiate cell-fate determination.
Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TISSUE SPECIFICITY.

C. In Devaloration as an inactive form which is proteolytically cleaved by a furin-like convertase in the which is proteolytically cleaved by a furin-like convertase in the trans-colgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleaved results in a C-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

C. PTM: Phosphorylated (By similarity).

SIMILARITY: CONTAINS 35 EGS-LIKE DOMAINS.

SIMILARITY: CONTAINS 2 LIN/NOTCH REPEATS.
                                    apoptotic programs. May play an essential role in postimplantation development, probably in some aspect of cell specification and/or differentiation (By similarity).

SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                  bonds (By similarity).

SUBCELLUIAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus. TISSUE SPECIFICITY: Highly expressed in the spheen and choroid plexus in the brain. Expressed in postnatal central nervous system (CNS) germinal zones and, in early postnatal life, within numerous cells throughout the CNS. It is more highly localized to ventricular germinal zones. Also found in the heart, liver and
Affects the implementation of differentiation, proliferation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kidney.

DEVELOPMENTAL STAGE: Expressed in the brain during E14 and E17

Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TMF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TISSUE SPECIFICITY: Expressed in the brain, kidney and spleen. Expressed in postnatal central nervous system (CNS) germinal zones and, in early postnatal life, within numerous cells throughout the CNS. Found in both subventricular and ventricular germinal zones. DEVELOPMENTAL STAGE: in the embryo, highest levels occur between days 12 and 14 and decrease rapidly to much lower levels in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Comp. Neurol. 436:167-181(2001).

- FUNCTION: Functions as a receptor for membrane-bound ligands Jagged1 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RRB-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). Acts instructively to control the cell fate determination of CNS multipotent progenitor cells, resulting in astroglial induction and neuron/oligodendrocyte
                                                                                                                                                                                                                                      "Notch! and Notch3 instructively restrict bFGF-responsive multipotent neural progenitor cells to an astroglial fate."; Neuron 29:45-55(2001).

```
-: SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.
-: ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be produced by alternative splicing.
-: TISSUE SPECIFICITY: Highly expressed in the brain, lung and thymus. Expressed at lower levels in the spleen, bone-marrow, spinal cord, eyes, mammary gland, liver, intestine, skeletal muscle, kidney and heart.
-: DEVELOPMENTAL STAGE: First detected in the mesoderm at 7.5 d.p.c. By 8.5 d.p.c. highly expressed in presonitic mesoderm, mesenchyme and endothelalum. Between 9.5-10.5 d.p.c. expressed at high levels in the neuroepithelium. At 13.5 d.p.c. expressed in the surface ectoderm, eye and developing whisker follicles.
-: PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a criminal fragment NITM) and a Neterminal fragment (RCC). Following ligand binding, it is cleaved by TNN-alpha converting enzyme (TACE) to yield a membrane associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a

T "Genome sequence and comparative analysis of the solvent-producing
T bacterium Clostridium acetobutylicum.";
J. Bacteriol. 183:4823-4838(2001).
I. Pacteriol. 183:4823-4838(2001).
I. Pacteriol. SbcCD cleaves DNA hairpin structures. These structures
can inhibit DNA replication and are intermediates in certain DNA
recombination reactions. The complex acts as 3'--5' double
strand exonuclease that can open hairpins. It also has a 5'
single-strand endonuclease activity (By similarity).
I. SUBLONIT: Heterodimer of sbcC and sbcD (By similarity).
I. SIMILARITY: BELONGS TO THE SMC FAMILY. SBCC SUBFAMILY.

C. -!- FUNCTION: MUSCLE CONTRACTION.

-!- FUNCTION: MUSCLE CONTRACTION.

-!- SUBBUNT: MUSCLE CONTRACTION.

-!- SUBBUNT: MUSCLE CONTRACTION.

-!- SUBDINIT: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2 HEAVY CHAIN SUBUNITS (MLC.).

-!- SUBCELLULAR LOCATION: Thick filaments of the myofibrils.

-!- DOMAIN: THE ROBLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28-RESIDUE REPRAY PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COILED COILE.

-!- PTM: TWO CYSTEINE RESIDUES IN THE SI DOMAIN ARE SELECTIVELY ALKYLATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.

-!- PTM: TWO CYSTEINE RESIDUES HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (LMM) AND 1 HEAVY MEROMYOSIN (HMM). IT CAN LATER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED

Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
 PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgin network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by INF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentil dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).
 PTM: Phosphorylated (viginilarity).
DISEASE: Defects in NOTCH3 are associated with CADASIL (Cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy) which causes a type of stroke and dementia of which key features include recurrent subcortical ischemic events and vascular dementia.
 DENTITYCALON OF LIGHTON TO LIGHTON TO LIGHTON OF LOOK OF
 Joutel A., Chabriat H., Vahedi K., Domenga V., Vayssiere C., Ruchoux M.M., Lucas C., Leys D., Bousser M.-G., Tournier-Lasserve E.; "Splice site mutation causing a seven amino acid Notch3 in-frame
 apoptotic programs (By similarity).

-!- SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity).

-!- SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.

-!- TISSUE SPECIFICITY: Ubiquitously expressed in fetal and adult
 'Strong clustering and stereotyped nature of Notch3 mutations in
 -!- SIMILARITY: BELONGS TO THE NOTCH FAMILY.
-!- SIMILARITY: CONTAINS 34 EGF-LIKE DOMAINS.
-!- SIMILARITY: CONTAINS 3 LIN/NOTCH REPEATS.
-!- SIMILARITY: CONTAINS 5 ANK REPEATS.
